

Compiler Construction

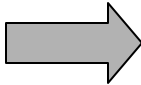

Lecture 10 - Optimization

What Is Optimization?

- The process of automated translation of a program will invariably introduced *inefficiencies*. Our goal in *optimization* is to remove as many of these inefficiencies as possible.
- Optimization can be *local* (optimizing basic blocks within a program) or *global* (across the entire program).
- Even after optimizing intermediate code, it may be necessary to optimize the final object code because of *inefficiencies introduced in final code generation*.

A Sample Program in JASON

```
PROGRAM MySample;
INTEGER x, Y;
BEGIN
  SET x = 12;
  SET Y = 3;
  WHILE Y ! 0 DO
    SET x = x + Y;
    SET Y = Y - 1
  ENDWHILE;
END.
```

```

X := 12
Y := 3
!_1:
if Y = 0 goto !_2
X := X + Y
Y := Y - 1
goto !_1
!_2:
```

Basic Blocks

- A ***basic block*** is a sequence of instruction that will be performed in sequence, always going from the beginning of the block to the end of the block without jumping out of the block.
- There may be more than one basic block that transfers control to a given block and there may be more than one basic block to which we will transfer control as we leave a given block.

The Basic Blocks Of Our Sample Program

Flow Graphs

Principle Optimizations On Basic Blocks

- There are several different optimizations that we can (and will) perform on basic blocks. They include:
 - Common Sub-expression Elimination
 - Copy propagation
 - Dead-Code Elimination
 - Arithmetic Transformation

Common Subexpression Elimination

<code>b := 4-2</code>		<code>b := 4-2</code>
<code>\$_1 := b / 2</code>		<code>\$_1 := b / 2</code>
<code>\$_2 := a* \$_1</code>		<code>\$_2 := a* \$_1</code>
<code>\$_3 := \$_2 * b</code>		<code>\$_3 := \$_2 * b</code>
<code>\$_4 := \$_3 + c</code>		<code>\$_4 := \$_3 + c</code>
<code>\$_5 := <u>\$_2 * b</u></code>		<code>\$_5 := <u>\$_3</u></code>
<code>\$_6 := \$_5 + c</code>		<code>\$_6 := \$_5 + c</code>
<code>d := \$_4 * \$_6</code>		<code>d := \$_4 * \$_6</code>

Common Subexpression Elimination

```
b := 4-2
```

```
$_1 := b / 2
```

```
$_2 := a* $_1
```

```
$_3 := $_2 * b
```

```
b := $_3 + c
```

```
$_5 := $_2 * b
```

```
$_6 := $_5 + c
```

```
d := $_4 * $_6
```

*We cannot use subexpression
elimination here because **b**'s
value was changed*

Copy Propagation

```
b := 4-2
```

```
$_1 := b / 2
```

```
$_2 := a* $_1
```

```
$_3 := $_2 * b
```

```
$_4 := $_3 + c
```

```
$_5 := $_3
```

```
$_6 := $_5 + c
```

```
d := $_4 * $_6
```

```
b := 4-2
```

```
$_1 := b / 2
```

```
$_2 := a* $_1
```

```
$_3 := $_2 * b
```

```
$_4 := $_3 + c
```

```
$_5 := $_3
```

```
$_6 := $_3 + c
```

```
d := $_4 * $_6
```

Subexpression After Copy Propagation

<code>b := 4-2</code>		<code>b := 4-2</code>
<code>\$_1 := b / 2</code>		<code>\$_1 := b / 2</code>
<code>\$_2 := a* \$_1</code>		<code>\$_2 := a* \$_1</code>
<code>\$_3 := \$_2 * b</code>		<code>\$_3 := \$_2 * b</code>
<code>\$_4 := \$_3 + c</code>		<code>\$_4 := \$_3 + c</code>
<code>\$_5 := \$_3</code>		<code>\$_5 := \$_3</code>
<code>\$_6 := \$_3 + c</code>		<code>\$_6 := \$_4</code>
<code>d := \$_4 * \$_6</code>		<code>d := \$_4 * \$_6</code>

Copy Propagation After Subexpression

<code>b := 4-2</code>		<code>b := 4-2</code>
<code>\$_1 := b / 2</code>		<code>\$_1 := b / 2</code>
<code>\$_2 := a* \$_1</code>		<code>\$_2 := a* \$_1</code>
<code>\$_3 := \$_2 * b</code>		<code>\$_3 := \$_2 * b</code>
<code>\$_4 := \$_3 + c</code>		<code>\$_4 := \$_3 + c</code>
<code>\$_5 := \$_3</code>		<code>\$_5 := \$_3</code>
<code>\$_6 := \$_4</code>		<code>\$_6 := \$_4</code>
<code>d := \$_4 * \$_6</code>		<code>d := \$_4 * \$_4</code>

Dead-Code Elimination

<code>b := 4-2</code>	<code>b := 4-2</code>
<code>\$_1 := b / 2</code>	<code>\$_1 := b / 2</code>
<code>\$_2 := a* \$_1</code>	<code>\$_2 := a* \$_1</code>
<code>\$_3 := \$_2 * b</code>	<code>\$_3 := \$_2 * b</code>
<code>\$_4 := \$_3 + c</code>	<code>\$_4 := \$_3 + c</code>
<code>\$_5 := \$_3</code>	<code>\$_6 := \$_4</code>
<code>\$_6 := \$_4</code>	<code>d := \$_4 * \$_4</code>
<code>d := \$_4 * \$_4</code>	

No references to `$_5` after defining its value

Arithmetic Transformations

- We can use the laws of algebra to replace expressions that either do not need to be calculated or can be calculated more quickly by other means.
- These algebraic transformations include:
 - Constant Folding
 - Algebraic Simplification
 - Reduction In Strength

Constant Folding

<code>b := 4-2</code>		<code>b := 2</code>
<code>\$_1 := b / 2</code>		<code>\$_1 := b / 2</code>
<code>\$_2 := a* \$_1</code>		<code>\$_2 := a* \$_1</code>
<code>\$_3 := \$_2 * b</code>		<code>\$_3 := \$_2 * b</code>
<code>\$_4 := \$_3 + c</code>		<code>\$_4 := \$_3 + c</code>
<code>\$_6 := \$_4</code>		<code>d := \$_4 * \$_4</code>
<code>d := \$_4 * \$_4</code>		

Copy Propagation & Dead-Code Elimination After Constant Folding

<code>b := 2</code>		
<code>\$_1 := b / 2</code>		<code>\$_1 := 2 / 2</code>
<code>\$_2 := a* \$_1</code>		<code>\$_2 := a* \$_1</code>
<code>\$_3 := \$_2 * b</code>		<code>\$_3 := \$_2 * 2</code>
<code>\$_4 := \$_3 + c</code>		<code>\$_4 := \$_3 + c</code>
<code>d := \$_4 * \$_4</code>		<code>d := \$_4 * \$_4</code>

More Constant Folding

<code>\$_1 := 2 / 2</code>		<code>\$_1 := 1</code>
<code>\$_2 := a * \$_1</code>		<code>\$_2 := a * \$_1</code>
<code>\$_3 := \$_2 * 2</code>		<code>\$_3 := \$_2 * 2</code>
<code>\$_4 := \$_3 + c</code>		<code>\$_4 := \$_3 + c</code>
<code>\$_6 := \$_4</code>		<code>d := \$_4 * \$_4</code>
<code>d := \$_4 * \$_4</code>		

More Copy Propagation & Dead-Code Elimination

<code>\$_1 := 1</code>		{	<code>\$_2 := a * 1</code>
<code>\$_2 := a * \$_1</code>			
<code>\$_3 := \$_2 * 2</code>			<code>\$_4 := \$_3 + c</code>
<code>\$_4 := \$_3 + c</code>			<code>d := \$_4 * \$_4</code>
<code>\$_6 := \$_4</code>			
<code>d := \$_4 * \$_4</code>			

Algebraic Simplification

- We can simplify our expressions by using algebraic identities:

$$x + 0 = 0 + x = x$$

$$x - 0 = x$$

$$x \bullet 1 = 1 \bullet x = x$$

$$x / 1 = x$$

Applying Algebraic Simplification

$\$_2 := a * 1$		$\$_2 := a$
$\$_3 := \$_2 * 2$		$\$_3 := \$_2 * 2$
$\$_4 := \$_3 + c$		$\$_4 := \$_3 + c$
$d := \$_4 * \$_4$		$d := \$_4 * \$_4$

After Copy Propagation & Dead-Code Elimination

<code>\$_2 := a</code>		<code>\$_3 := a * 2</code>
<code>\$_3 := \$_2 * 2</code>		<code>\$_4 := \$_3 + c</code>
<code>\$_4 := \$_3 + c</code>		<code>d := \$_4 * \$_4</code>
<code>d := \$_4 * \$_4</code>		

After Copy Propagation & Dead-Code Elimination

<code>\$_2 := a</code>		<code>\$_3 := a * 2</code>
<code>\$_3 := \$_2 * 2</code>		<code>\$_4 := \$_3 + c</code>
<code>\$_4 := \$_3 + c</code>		<code>d := \$_4 * \$_4</code>
<code>d := \$_4 * \$_4</code>		

Reduction In Strength

- We can replace multiplication and division (or exponentiation) with addition and subtraction (or multiplication) which can usually be done much more quickly.
- We can use the identities:
 $x^2 = x \cdot x$
 $2 \cdot x = x + x$
- We can also use shifts to replace multiplication and division by powers of 2

Applying Reduction In Strength

$\$_3 := a * 2$	\Rightarrow	$\$_3 := a + a$
$\$_4 := \$_3 + c$		$\$_4 := \$_3 + c$
$d := \$_4 * \$_4$		$d := \$_4 * \$_4$

Our End Result

<pre>b := 4-2 \$_1 := b / 2 \$_2 := a* \$_1 \$_3 := \$_2 * b \$_4 := \$_3 + c \$_5 := \$_2 * b \$_6 := \$_5 + c d := \$_4 * \$_6</pre>		<pre>{ \$_3 := a + a \$_4 := \$_3 + c d := \$_4 * \$_4 }</pre>
